Abstract

We show that at least two empty pages are accepted at SIGBOVIK.

Paper maximization is an important subject [1], [2]. However, existing techniques requires effort from authors. Recently, Skarman [3] proposed a zero effort technique for paper maximization through simply adding a sequence of blank pages inside the paper. However, it is not yet known how many blank pages a reputable venue like SIGBOVIK will accept. Skarmans groundbreaking research showed a lower bound on of one page. In this follow-up study we extend their research to show that 2 blank pages in sequence are also accepted.
