Abstract

We show that at least four empty pages are accepted in a top tier journal.

Paper maximization is an important and well studied subject [1, 2]. However, existing techniques requires effort from authors. Recently, Skarman [3] proposed a zero effort technique for paper maximization through simply adding a sequence of blank pages inside the paper. Initial results showed that a single empty page is accepted, and this result was further refined to two pages in a follow-up study [4]. However, it is still not yet known how many blank pages a reputable venue like SIGBOVIK will accept. This work further refines the upper bound to show that four empty pages are accepted.
